

A specialized business insurance and risk management intermediary company was looking to downsize their IT infrastructure footprint and take advantage of cloud modernization.

The challenge

A trusted partner was needed to help assess their colo environment, **create a migration roadmap** to the cloud, and help them execute the migration.

There was a sense of urgency because their colo environment was closing in five months. They desired a **trusted partner**, who could not only ensure they met their deadline but who would also build **a solid cloud foundation** based on deep expertise, experience and best practices.

The strong cloud foundation would be critical to ensuring not just a **successful migration**, but **strong governance** and controls, and a foundation from which they could continue to modernize and evolve their cloud-based services long term.

The solution

- The Inviso team assessed, planned and migrated the Colo Data Center to Azure, including CAF workshops and a Landing Zone design to ensure proper governance and controls were thought through from the outset of the project.
- For this company, this approach **accelerated their timelines to meet their deadline.**
- The migration from their legacy architecture to Azure **removed their dependency on the aging physical infrastructure, enabled greater business agility, avoided wasteful CapEx**, and unlocked the opportunity for broader adoption of the Azure Cloud by other departments.

The results

“Inviso immediately became a trusted team member, masterfully guiding us through a complex Azure Migration on time and within budget. With a deep resource bench supporting the project, Inviso’s staff worked through unexpected changes with determination and grace.”
Company SVP of IT.

Increased resiliency by moving this company to Azure as primary data center

Provided hands-on deployment to accelerate and manage the process
